# Introduction

## Preliminary Remarks

---

- The intention of this presentation is to provide up-to-date information. However, facts and figures change rapidly, and the given information may soon be outdated again.
- This work has been carried out under the responsibility of Dr. Simon Philipps (Fraunhofer ISE) and Werner Warmuth (PSE Projects GmbH).
- Price indications are always to be understood as nominal, unless stated explicitly. For example, prices in the learning curves are inflation adjusted.
- The slides have been made as accurate as possible. Please send any comments or suggestions for improvement to both [simon.philipps@ise.fraunhofer.de](mailto:simon.philipps@ise.fraunhofer.de) and [warmuth@pse-projects.de](mailto:warmuth@pse-projects.de)
- Please cite the information presented in these slides as follows:

# Executive Summary

## PV Market: Global

---

- Photovoltaics is a fast-growing market: The Compound Annual Growth Rate (CAGR) of cumulative PV installations was about 27% between the years 2014 and 2024.
- Wafer size increased. Keeping the same number of cells, larger PV module sizes are realized, allowing a power range of over 700 W per module.
- In 2024, Europe's contribution to the total cumulative PV installations amounted to 23%. In contrast, installations in China accounted for 49% (in 2023 43%) and in North America for 5% respectively.
- Silicon wafer-based technology accounted for about 98% of total production in 2024 with a 70% share of n-type wafers according to ITRPV. Monocrystalline technology became the dominant technology in c-Si production.
- Market shifts from subsidy-driven to a competitive pricing model (Power Purchase Agreements PPA).
- In addition to building-integrated (roof or building facades) and ground-mounted systems, more and more PV systems are being installed on agricultural land (agrivoltaics) and bodies of water (floating PV). Furthermore, vehicle-integrated PV enters the market.
- With increasing share of power generated by renewables, the integration of batteries with energy management systems is becoming increasingly important.

# Executive Summary

## PV Market: Focus Germany

---

- In 2024, PV installations in Germany (approximately 4.8 million PV systems with a capacity of over 800 W) accounted for about 4.6% (100 GWp) of the cumulative PV capacity installed worldwide (2156.5 GWp). According to the BNA, newly installed capacity in Germany amounted to approximately 16.9 GWp in 2024, compared to 15.3 GWp in 2023.
- In 2024, PV accounted for 14.5% of net electricity generation and all renewable energies for around 62%.
- In 2024 GHG emissions of about 51 million tons CO<sub>2</sub> equivalents were avoided due to 74 TWh PV electricity consumed in Germany.
- PV system performance has strongly improved. Before 2000 the typical Performance Ratio was about 70%, while today it is around 80% to 90%.
- Today residential and small commercial PV systems are often installed together with battery storage and a charging station for electric vehicles. Due to relative high electricity tariffs in Germany, self consumption is the prevailing business model. The installation of balcony solar systems is another growing trend.
- With increasing generation capacity from solar and wind, the flexible integration of volatile electricity into the grid becomes more important. Grid expansion, load management, smart grids, bidirectional charging of vehicle batteries, etc. must be promoted in order to avoid curtailment of renewable power plants.

# Executive Summary

## Solar Cell / Module Efficiencies

---

- The record lab cell efficiency\* is 27.4% for monocrystalline and 24.4% for multicrystalline silicon wafer-based technology. The highest lab efficiency in thin film technology is 23.4% for CIGS and 21.0% for CdTe solar cells. Record lab cell efficiency for perovskite solar cells is 25.2%.
- In the last 10 years, the efficiency of commercial monocrystalline wafer-based silicon modules increased from about 16% to values over 22%. At the same time, the CdTe module efficiency increased from 9% to 19%.
- In the laboratory, the best performing modules are based on monocrystalline silicon with 25.4% efficiency. Record efficiencies demonstrate the potential for further efficiency increases at the production level.
- In the laboratory, high concentration multi-junction solar cells achieve an efficiency of up to 47.6% today. With concentrator technology, module efficiencies of up to 38.9% have been reached.

# Executive Summary

## Energy Payback Time

---

- Silicon usage for silicon cells has been reduced significantly during the last 20 years from around 16 g/Wp (in 2004) to about 2.0 g/Wp in 2024 due to increased efficiencies, thinner wafers (140  $\mu\text{m}$ ) using diamond wire saws, and larger ingots.
- The Energy Payback Time of PV systems is dependent on the geographical location: PV systems manufactured in Europe and installed in Northern Europe require approximately 1.1 years to pay back the energy input, while PV systems installed in the South require 0.9 years to pay back the energy input, depending on the technology installed and the grid efficiency.
- A PV system located in Sicily using wafer-based silicon modules has an Energy Payback Time of about one year. Assuming a 20-year lifetime, this type of system can produce twenty times the energy invested in it.
- PV modules can be recycled, recovering rare and valuable materials. Further research and development is needed to make these recycling processes more in-depth and cost-effective.

# Executive Summary

## Price Development

---

- Due to the coronavirus crisis and the associated disruptions to supply and trade chains, market prices rose noticeably in 2022 and at times some products were not available in sufficient quantities. In 2023 prices fell again and have continued to fall in 2024.
- In Germany, a typical 10 to 100 kWp PV rooftop-system cost around 14,000 €/kWp in 1990. At the end of 2024, such systems cost less than 9% of that in 1990. Over the last 34 years, the compound annual growth rate (CAGR) of net prices was -6.9%.
- The Experience Curve (also called Learning Curve) shows that in the last 44 years the module price decreased by 25.7% with each doubling of the cumulated global module production. Cost reductions result from economies of scale and technological improvements. The global average selling price (ASP) was about 0.13 US\$/Wp in 2024.

## Global Annual Production

### Annual Production Today

Annual production has increased 14-fold over the past decade. In 2024, approximately 96% of solar modules and their components came from Asia, primarily from China with a module production share of about 80%, which also controls more than 95% of the market for certain components, such as ingots and wafers.

# Global Cumulative PV Installation

## By Region

Note: Cumulative installed capacity is considered here as 'aggregate annual additions.'

Data: IRENA 2025. Graph: PSE Projects GmbH 2025. Date of data: 24.03.2025

# Global Cumulative PV Installation

## Cumulative Installed On-Grid and Off-Grid Capacity (2010-2024)

Percentages show share of cumulative off-grid PV installations in relation to total cumulative PV installations. Approximately 99.6% of today’s installed PV capacity is connected to the grid.

The proportion of off-grid systems compared to the total cumulative systems has roughly halved over time from just under 1 % in 2010 to 0.40 % in 2024.

Data: IRENA 2025. Graph: PSE Projects GmbH 2025. Date of data: 04/2025

# Global Cumulative PV Installation by Region Status 2024

The total cumulative installations amounted to about 2,156.5 GWp according to IEA-PVPS at the end of year 2024; IRENA reports 1,858.6 GWp.

All percentages are related to global installed PV capacity, including off-grid systems.

# Annually Installed PV System Capacity in Germany

## Percentage of Annual Capacity by System Size

# Number of Total Cumulative PV Installations by System Size in 2024

## Germany

At the end of 2024, about 4.8 million grid-connected PV systems were installed in Germany.

**Note:**  
In 2024, around 800,000 plug-in systems (up to 800 W feed-in power from so-called balcony PV systems), were registered in Germany. Due to underreporting, the actual number is estimated to be around 3 million installed systems. [1]

© Fraunhofer ISE

# Total Cumulative Capacity of PV Installations by System Size in 2024

## Germany

PV Capacity (in MW<sub>p</sub>) and Share of All Grid-Connected PV Systems

PV Capacity (in MW<sub>p</sub>) and Share of All Systems >500 kWp

At the end of 2024, total cumulative PV capacity in Germany amounted to around 100.1 GWp.

© Fraunhofer ISE

**Note:**  
Balcony solar systems (up to 800 W feed-in power) accounted for 720 MW<sub>p</sub> in 2024. These were mostly within the building PV system class ( $x \leq 10$  kW<sub>p</sub>), [1].

# Share of Residential Rooftop Systems with and without Battery Storage

## Germany

Share at the End of 2023

Share in Year of Commissioning

By the end of 2023, over 1.2 million units, or 40 percent of all residential PV systems have a battery energy storage system (BESS).

The share of commissions for residential rooftop PV systems with BESS increased from <20% in 2014 to nearly 80% in 2023.

© Fraunhofer ISE

Note:  
Residential rooftop PV systems are defined as all systems on buildings with a maximum capacity of 30 kWp according to MaStR-Data.

# Share of PV Installations with and without Battery Storage, BESS

## Commercial Rooftop and Utility-Scale Systems in Germany

The share of commissions for PV installations with BESS increased from 5% in 2014 to 20% in 2023 in the commercial rooftop sector.

Note: Commercial rooftop PV systems are defined as all systems on buildings with a capacity greater than 30 kWp according to MaStR-Data.

In 2022 and 2023 there was a significant increase in commissions for PV with BESS, reaching a share of around 7% in the utility-scale PV power plant sector.

Note: Utility-scale ground-mounted PV systems are defined as all ground-mounted systems with a capacity greater than 1 MWp according to MaStR-Data.

# Electrical Capacity of Renewable Energy Sources (RES) Germany

Renewable energy sources accounted for 188.4 GW of the total 263.9 GW net installed electricity generation capacity in Germany in 2024, resulting in a RE share of 71.4% of total capacity.

# PV Energy Generated and Resulting GHG Emissions Avoided

## Germany

In 2024, greenhouse gas emissions of about 51 Mio. t CO<sub>2</sub>-equivalent were avoided due to 74 TWh PV electricity consumed in Germany.

- Performance Ratio (PR)

# Development of Laboratory Solar Cell Efficiencies

Data: Solar Cell Efficiency Tables (Versions 1 to 66), Progress in Photovoltaics: Research and Applications, 1993-2025. Graph: Fraunhofer ISE 2025. Date of data: 04/2025

# Efficiency Comparison of Technologies

## Best Lab Cells vs. Best Lab Modules

Note: In mass production, the cell-to-module ratio (CTM) improved in past years by reducing losses and using possible gains when integrating solar cells in modules.

Fraunhofer ISE provides the software suite SmartCalc.CTM for determining precise Cell-to-Module (CTM) power loss analyses. Geometrical losses, optical losses and gains as well as electrical losses are considered in the analysis.

# Current Efficiencies and Power of Commercial PV Modules

## Sorted by Technology

- Total weighted average efficiency of crystalline Silicon (c-Si) wafer-based modules is 22.0% in Q4-2024 (21.6% in Q4-2023); weighting factor is total shipments in year 2023. Lowest module efficiency in this group is 18.8% (17.4% one year before) and highest value is 23.8% (23.3% in 2023).
- Top 10 manufacturers represent about 85% of total shipment volume in 2023 and origin mainly in Asia.
- n-type TopCon and Heterojunction replaces p-type PERC technology.

Note: The selection is based on modules from the top 10 manufacturers in 2024, with module data sheets available worldwide at the end of October 2024. For CdTe, only data from First Solar and for CIGS technology, only modules from Avancis have been considered due to limited number of suppliers. Some products for Building-Integrated PV (BIPV) have not been considered.

### 3. Life Cycle Assessment (LCA) and Sustainability Aspects

---

- Silicon usage, wafer thickness and kerf loss for c-Si
- Energy Payback Time EPBT: Development and comparison

# c-Si Solar Cell Development

## Wafer Thickness [ $\mu\text{m}$ ] & Silicon Usage [g/Wp]

Polysilicon consumption in solar cell production (in grams per watt-peak) has decreased by almost 10% year-on-year since 2004 due to:

- reductions in wafer thickness
- kerf loss, and
- by process optimizations such as recycling silicon from kerf loss
- Progress in cell efficiency also has impacted the specific silicon usage.

Data: until 2012: EU PV Technology Platform Strategic Research Agenda, from 2012: ITRPV; ; from 2016 ISE without recycling of Si; from 2017 ongoing with recycling of Si. Graph: PSE Projects GmbH 2025

# Energy Payback Time: Historical Trend

## Harmonized Study Data for Monocrystalline Silicon Rooftop PV Systems

### Learning Rate:

Each time the cumulative production doubled, the EPBT went down by 12.8 % over the last 24 years.

|                                                                                                                                                                             |              |

Irradiation: 1700 kWh/m²/a at an optimized tilt angle; **Years:** Estimated average year of original data

# Energy Pay-Back Time of Silicon PV Rooftop Systems

## Geographical Comparison

- Rooftop PV system using mono-crystalline silicon cells\* produced in China
- EPBT is dependent on irradiation, but also on other factors like grid efficiency\*\*.
- Better grid efficiency in Europe may decrease the EPBT by typically 9.5 % compared to PV modules produced in China.

Data source: Fraunhofer ISE. Image: JRC European Commission. Graph: PSE Projects GmbH 2020 (Modified scale with updated data from Fraunhofer ISE)

# World Map EPBT of Silicon PV Rooftop Systems

## Comparison of EPBT China

### Influencing Factors and Interpretation

- **EPBT:** the lower, the better
- **Irradiation:** the higher, the better
- **Grid efficiency:** the higher, the better
  - in countries where upstream production is located (better energy mix to generate electrical power, less losses in the electrical transmission network), and
  - at downstream (where PV is installed) a low grid efficiency reduces the EPBT.

EPBT = Energy Pay Back Time in years: Calculated for a PV system with Cz PERC 60-cell modules with 19.9 % efficiency, produced in China

Data source: Fraunhofer ISE.

# Energy Payback Time of Silicon PV Rooftop Systems

## Comparison of EPBT China / EU, Local Irradiation and Grid Efficiency in 2021

EPBT for PV systems produced in Europe is shorter than for those produced in China because of better grid efficiency in Europe.

Data source: Fraunhofer ISE. Calculations for year 2021 made at 22-July 2022

# PV Module

## Materials and Components

**Please note:** Highly transparent glass can also be produced without antimony (Sb), and some European suppliers are doing so. It is technically feasible to recycle and reuse almost 100% of the materials used in PV modules. The European WEEE Directive stipulates that at least 80% of the module mass of old modules must be processed and recycled for reuse. For economic reasons, however, only the glass, frame and junction box (J-Box) are recycled today.

# PV Market Development and Incentive Schemes in Germany

Data: BNA. Graph: B. Burger, Fraunhofer ISE Energy-Charts. Date of Data: 09.04.2025

| Market Incentive           | Start | End     |
|----------------------------|-------|---------|
| 1'000 Roofs Program        | 1990  | 1995    |
| Cost-covering remuneration | 1993  | 1999    |
| 100'000 Roofs-Program      | 1999  | 2003    |
| EEG                        | 2000  | ongoing |
| PV Tendering scheme        | 2015  | ongoing |

The EEG 2023 law relies on a massive expansion of renewable energies with total installed PV capacity targets of 215 GW in 2030 and 400 GW in 2040. In 2024, new PV systems totaling around 16 GW capacity have been connected to the grid. From 2026 on, the expansion target is 22 GW of new installations on an annual basis.

# PV Tender Scheme in Germany for Free-Standing Systems

Average, quantity weighted award value

- The PV tender scheme for large ground-mounted systems started in April 2015. The total capacity of this scheme amounted to 21.8 GW in December 2024 with 4.76 ct€ / kWh as latest average quantity weighted award price.
- PV-rooftop and special tenders are not displayed in the graph.

Data: BNA. Graph: PSE Projects GmbH 2025 – Date of data: 04/2025

# PV-Tender in Germany for Large Rooftop-Systems

Average, quantity weighted award value

Data: BNA. Graph: PSE Projects GmbH 2025 – Date of data: 05/2025

- PV tender scheme for large rooftop systems (>750 kW) started in June 2021 and total capacity of this scheme accumulates to 2.2 GW by October 2024 with 10.5 ct€ / kWh as latest average quantity weighted award price.
- Lowest PV tender round was in June 2021 with 6.88 ct€ / kWh as average quantity weighted award price.

# Global Weighted Average Levelized Costs of Electricity for Large PV Systems (with 5th percentile and 95th percentile)

- The global weighted average LCoE for 2023 for large PV systems is 0.036 €/kWh (= 36 €/MWh).
- The 5th percentile is a value associated with the location within the data where 5% of the data is below that value. For 2023, the 5th percentile is 0.025 €/kWh (= 25 €/MWh).
- The 95th percentile is the value where 5% of the data has a higher value. For 2023 the 95th percentile is 0.089 €/kWh (= 89 €/MWh).
- The LCoE has decreased by 16% year-on-year over the last 13 years.

Data: IRENA (2024), Renewable Power Generation Costs in 2023, International Renewable Energy Agency, Abu Dhabi.  
Currency converted from USD to EUR. Date of data: Sep-2024

# Global Weighted Average Total Installed Costs For Large PV Systems (with 5th percentile and 95th percentile)

- The global weighted average total cost for large PV systems was 617 €/kWp in 2023.
- The 5th percentile is a value associated with the location within the data where 5% of the data is below this value. For 2023 the 5th percentile is 429 €/kWp.
- The 95th percentile is the value where 5% of the data has a higher value. For 2023, the 95th percentile is 1355 €/kWp.
- Total installed cost for large PV systems decreased by about 13% on year-to-year basis in the last 13 years.

The information provided in this Photovoltaics Report is very concise by its nature . Its principal purpose is to provide a rough overview about the current solar PV market, the technologies and the environmental impact.

However, there are many more aspects. These and further details can be provided by Fraunhofer ISE upon request. Please contact us if you are interested in receiving a tailor-made offer.
